KONA

The world is changing. In this day and age the bicycle sits at the front of a great shift. Revolutionary by design, our Noblest Invention. When you ride the world's most efficient machine, you become its most efficient animal. Two wheels and the most beautiful way through the world.

What's happening? North American cities are finally building cycling into their transportation infrastructure. Around the world kids are doing 360s before they hit double digits. And mountain bike technology is breaking new ground faster than you can say, "hot burning magma."

At Kona, we're all about the freedom and empowerment of the bicycle. We have been since 1988. We still have the same founding owners. We're still populated by a staff of keen, active, impassioned cyclists. We're not big, nor are we that small. Just a dedicated group of cyclists making bicycles for people who love bikes—no matter if that love is new or long established.

It's why we have 67 different models this year—bicycles that cover the two-wheeled spectrum. Over the years, we've focused on evolving our bikes from better to best, obsessed with making every major and minor improvement possible. For 2011, there's revolution to build on this evolution. We've added new and fresh ideas by investing more in people and technology than ever before. It's part of the process of completely re-inventing what Kona stands for. The results are our first carbon bikes, designed and built from the ground up. A completely new Freeride machine and more Magic Link platform technology. Capped by a newly minted range of state-of-the-art electric assist bikes to complete our rapidly growing and multicultural fleet of commuter machines. A new era in cycling is emerging in our little bike company that could.

At our core, we want bicycles to do more. Inspiring people to explore the natural world. Allowing them to experience self-propelled velocity, from women who must travel 10 miles a day to fetch water, to those trying to forego car culture altogether. We want them to promote healthy lifestyles, whether you are five, or 85. Most of all, we want the bicycle to bring people big, unabated, totally ridiculous fun.

One thing we always keep in mind is you're only as good as your latest ride. We're going to keep making sure the next one is even better.

Enjoy the ride.

—The Kona Crew

STEEL IS REAL

We've never given up on the original mountain bike material. You'll find the simplicity, strength, comfort, resilience, and playfulness of steel sprinkled throughout our line of road, asphalt and mountain bikes.

7005 ALUMINUM

Aluminum is currently the most widely used tubing material in the bicycle industry. Aluminum is often mixed with a number of other elements to create aluminum alloys featuring a host of different ride characteristics, while increasing mechanical properties. Much of our tubing is butted and/or formed, meaning that the wall thickness of the tubing can be increased or decreased, as well as shaped, allowing us to fine tune a particular frame's ride characteristics depending on the application. Kona uses butted 7005 aluminum extensively throughout our entire range of mountain, asphalt and road bicycles. A tough, durable, affordable, light, and dependable alloy, 7005 delivers great performance that lasts for thousands of rides. It is, by far and away, the ultimate aluminum tubing on the market today.

KONA RACE LIGHT 7005

Kona Race Light 7005 is a lighter, more performance oriented fabrication of our 7005 Aluminum tubing. Designed to Kona's racing specifications, the biggest difference is custom butting. The tubing is thicker at weld areas and important parts of the frame, providing great strength and torsional integrity to the ride. We remove wall thickness in other parts of the frameset to lighten up the bike, providing the perfect balance between quickness and stiffness. The emphasis here is on performance rather than durability, for applications where speed is more important than longevity.

KONA RACE LIGHT SCANDIUM

Known to be one of the lightest and strongest alloys in the world, with superior ride characteristics, Kona Race Light Scandium is featured in many of our high-end bike models — from dual suspension mountain bikes through to some of our top ranking asphalt bikes.

Scandium is a potent grain refiner that when added to aluminum alloys, elevates the strength and durability of the material by 50%. It accomplishes this by aligning the grains of the alloy, making the metal less susceptible to failure.

Kona Race Light Scandium alloy is twice as strong as 6061 or 7005 aluminum, allowing our engineers to use much less material. Because of the material's strength, it can be butted thin enough to give the aluminum a more compliant ride similar to steel but without weight. In more specific terms, we're shaving weight from our aluminum frames by 10-to-15%, without sacrificing strength and durability.

For 2011 you'll find Kona Race Light Scandium sprinkled throughout our entire line of bikes. Most notably, our Abra Cadabra 100-160mm variable travel backcountry bike uses a Scandium frame, a testament to our commitment and faith in one of the world's most rigorous materials.

Kona Race Light Scandium Highlights:

- Light as titanium
- More durable than carbon
- Half the weight of steel
- Five times stronger than aluminum
- Fast as light

KONA RACE CARBON FIBER TECHNOLOGY

New for 2011, Kona introduces two new carbon fiber bicycles, the Kula Watt, a lightning quick hardtail cross-country mountain bike, and the Major Jake, our top-of-the-line cyclocross race bike. Both Kona designed bicycle frames are built at one of the most advanced bicycle manufacturing facilities in the world, Hodaka. In addition to producing cold-forged bicycle and frame components including wheels for Shimano and Easton, Hodaka employs a carbon fiber fabrication process that leads the industry. Combine Kona's race proven geometries with one of the lightest, strongest and ride savvy materials on the planet, in a facility known for its innovation, leadership, and attention to detail, and you have some of the most beautifully riding bicycles on the planet.

- The Technology: Kona Race Carbon Fiber bicycles use Prepeg technology – specially formulated resin matrix systems reinforced with man-made fibers such as carbon, glass and aramid. When cured, the Prepegs

used in Kona frames represent an incredibly solid structural material that is highly durable, temperature resistant, exceptionally stiff, and lightweight. These resin formulations and fiber impregnation technologies are designed in concert with Kona's stringent product design requirements, allowing our bikes to achieve the ultimate balance between stiffness, lightweight, and ride quality.

- The Material: To create an unprecedented level of toughness, stiffness and good anti-vibration properties, epoxy resins used in the Major Jake and the Kula Watt use a special Nanopowder technology. Nanopowder resin is designed to fill microscopic gaps (see them like "nano" holes between the carbon layers) between the carbon fibers themselves, making the frame more homogenous (the forces generated while riding the bike are running through a more compact structure), lighter, and more comfortable. The result of having limited internal gaps also drastically reduces potential breaking points, increasing the fatigue limit of Kona frames by more than 30% over standard carbon monocoque frames.
- Molding Process: At the bottom bracket, head tube and seat area, Kona Race Carbon Fiber frames use special internal silicon shells which increase the compression of carbon fibers layered in the mould. The method prevents the internal formation of wrinkles, another potential breaking point that, when avoided, increases the fatigue resistance of the bike, while at the same time, resulting in a lighter frame.

SLOPING TOP TUBE

Kona recognized the advantages of sloping top tube frame design right from the original models we made in 1988, designed by inaugural MTB Hall of Fame legend Joe Murray. As a company, we've stayed true to this philosophy, going so far as to pioneer the design in road bikes before the benefits were understood. Today, you'll find sloping top tubes in most high-end road race bicycles. We've since stayed true to all the many positives this design brings to overall bike performance and comfort.

First, this design allows the top tube to be lower, providing more room for correct positioning and free body movement, enabling more standover clearance, which is particularly useful on dual suspension bikes that have higher bottom brackets. Riders have a more secure riding position, which is especially beneficial when riding downhill sections.

Also, the top tube is longer and more compliant. As the top and down tube become more parallel, there's less triangulation, resulting in more compliance. So not only is the frame stronger and more responsive, but it absorbs more shock than frames with horizontal top tubes.

COMPACT REAR TRIANGLE

Short chain stays and seat stays provide a perfect balance of stability and power transfer when out of the saddle and pedaling hard. Shorter seat stays also have less deflection during braking and accelerate quicker than longer stays. The shorter rear triangle also helps the bike to negotiate tight twisting sections of trail.

HYDROFORMED TUBING

For 2011, you'll find formed tubing on a great number of our bicycles. Hydroforming uses water specifically, but we also use Superplastic formed tubing, shaped using air, or cold formed tubing. This not only allows a tube to be tuned for compliance on specific planes but it also improves grain alignment and increases all mechanical properties.

Hydroforming is a tube shaping technology that uses super high-pressure liquid to form the shape of a tube and align its grain structure. Quite simply, the technology delivers a sound structure and ride performance like no other tubing in the world. The process results in a seamless, continuous, aligned piece of metal right down to the fiber structure itself.

Hydroforming proves especially advantageous at weld points where it can be flared to increase weld areas, adding strength without adding weight in the form of extra gussets. The result is a strong, flawless frame with great lateral stability, durability and responsiveness. Not to mention, it looks real sharp too.

SUPERPLASTIC FORMED TUBING

Superplastic Forming (SPF) uses high temperatures to shape tubes, when the tube structure is in its most 'plastic' and formable state. SPF allows for better tube shapes that cannot be produced using traditional forming techniques. Whereas shape designs can be applied to 20% - 30% of the tube using hydroforming, SPF allows up to 90%. The result: more optimized shapes and lesser weight. SPF tubes are the perfect alternative to the infinitely more expensive carbon fiber – comparable in weight and performance, without the accompanying disadvantages. SPF tubes are also recyclable.

SPF Tubing is featured on the following Kona 2011 models: Blast, Cinder Cone, Caldera, Kula Lisa, Dew FS, Dr. Dew, Dew Deluxe, and Dr. Good.

INTERNAL HEADSET

By having the headset bearing located inside the headtube (what's sometimes called zero stack), rather than the top and bottom, we are able to achieve a wide array of advantages when it comes to front end stiffness and overall riding performance. With an internal headset, the head tube is able to take the stress directly, resulting in less play and less wear, with strong ride characteristics, and better bearing performance.

An internal headset also reduces stack height, enabling the height of the stem and bars to be more adjustable, the bike has more setup options, resulting in the best fit possible.

TAPERED HEAD TUBE

For 2011, a wide variety of Kona bicycles feature tapered head tubes, meaning the top of the head tube is 1-1/8-inches at the top, while the bottom is 1.5-inches. From our cyclocross bikes to our cross-country mountain bikes, right through to longer travel dual suspension models, like our Cadabras and CoilAirs, a tapered head tube provides more support at the intersection of the top tube and down tube.

The design also offers a more solid interface between forks with tapered steer tubes and the bicycle frame itself. More girth at the bottom of the head tube better distributes shock force, prolonging the bearing life of the

headset itself. The design also allows for a stronger steering position and improved balance, giving the rider more control in rough terrain.

KONA MAGIC LINK ACTIVE GEOMETRY

With the ability to change geometry, travel and suspension on the fly, Kona's patented Magic Link Active Geometry represents a new era in dual suspension mountain biking. Released in 2008, Magic Link is a completely intuitive system. It's always on. You and the trail are the switch.

- **Climbing:** Increased pedal pressure keeps the Magic Link's auxiliary shock from engaging, retaining good pedaling geometry and firmer suspension characteristics. Everything you need for comfort, traction and efficient power transfer.
- **Cross-country:** Tyre drag, faster corners and bigger bumps cause the Magic Link's auxiliary shock to move deeper into its travel. Chain stays elongate, the saddle and bottom bracket lower, and the head tube slackens, all amounting to an agile, confident riding position, with increased wheel traction and pusher travel.
- **Descents:** When the main shock and the auxiliary shock fully engage, Magic Link allows the bike's geometry to slacken considerably, enabling the rider to position themselves further behind the bike, with a lower center of gravity and extended rear triangle for increased stability.
- **Variable Spring Rate:** Throughout all three modes, Magic Link's two separate shocks work in series, providing a variable spring rate that is lower and more plush in descend mode. Working in series also allows the rear wheel to pop over big, sharp bumps with virtually no resistance. Because the main shock becomes more progressive as the link engages, it won't blow through the travel and it won't bottom out.
- **Extended Travel:** Finally, Magic Link also has the ability to lengthen rear travel. In our Cadabra models, travel ranges from 100mm in climbing mode to 160mm when fully engaged. In our CoilAir series travel ranges from 125mm to 200mm. In our brand new 2+2 cross-country models, travel ranges from 50mm to 100mm.

KONA WALKING BEAM 4-BAR LINKAGE SYSTEM

Since Kona first introduced the platform in 1996, we've been refining and honing the most functional, durable and performance-oriented dual suspension platforms ever invented. That's why you see versions of our 4-Bar linkage on everything from the Hei Hei XC Race bike to our DH Stab Supreme.

- Function and Durability:** Anytime you have a pivot in anything, there is side-to-side movement, or tolerance. It's what allows the pivot to move freely. When you have pivots that are close together, like in more complicated multi-pivot designs, the side-to-side movement in those pivots becomes amplified, what's called tolerance stacking. Kona's 4-Bar system keeps pivots as far away from each other as possible, thus minimizing tolerance stacking. Ultimately, it equates a stiffer rear end, as well as a significant decrease in bearing and bushing wear. Another benefit of our 4-Bar system is minimized side load on the rear shock. If you've got close pivot points and/or the shock positioned so that it is exposed to lateral forces, you've got side load on the shock. Side load causes resistance, which negatively impacts suspension performance. Side load also causes premature seal failures. With our 4-Bar system the rear shock is protected from side-to-side forces. As a result, we have a super low rate of shock problems, as well as a very responsive feel to the rear suspension.
- Tunability:** 4-Bar allows for a rainbow of different suspension characteristics, after all, this is the suspension platform used for F1 racecars. For XC bikes, we can take an inherently progressive air shock and make the suspension more linear, allowing the rider to benefit from all of the bike's travel. For downhill bikes, like our Operators, an inherently linear coil shock can be set-up to be more progressive for big hits.
- Plush Factor:** Void of gimmicks, with pivots, bearings and the shock itself well supported, Kona's Walking Beam 4-Bar Linkage System delivers that beautiful, super plush feel we all crave as mountain bikers. Whether it's taking the edge of a technical XC race course, the burl out of a backcountry all-day

epic, or smoothing the brake bumps at your local bike park, our 4-Bar suspension designs deliver bomber plushness, ride in, ride out.

ASYMMETRICAL CHAIN STAYS

When a rider puts force into the bicycles drivetrain (cranks, chain and rear cassette), not only are they propelling the bike forward, they're also putting a significant amount of torsion on the rear chain stays. Because the drivetrain is on one side of the bicycle, the frame wants to flex laterally. It is the one element of bike design that's not in perfect balance.

Used primarily on our dual suspension mountain bikes, asymmetrical stays help to stiffen the rear end by compensating for the offset forces of this imbalance. The drive-side stay is straight, while the nondrive takes advantage of no chain rings and chain, better able to deal with the torque, effectively countering the torsional forces in the rear triangle. By putting strength where it is needed, pedaling stiffness and rider efficiency is greatly increased.

ELECTRIC-ASSIST

Using low profile, re-chargeable Samsung 18650 Lithium Ion batteries, Kona's electric assist technology is based on 700C bicycle trekking types that use a 24-volt, 250W battery-assisted Pedelec motor. Using a patented Dutch design TMM torque sensor and a precise digital processor, the power assist from the front wheel drive motor can be delivered in proportion with the exact power output of the rider. The result is a very smooth, effortless ride.

The system's battery capacity is 24V with 10Ah (Amp Hour), (24V 13Ah for the Electric Ute) delivering a long lifecycle of more than 700 rides. In power mode, the system can assist riding for up to 30km. In normal mode, power assist lasts up to 57km, while in economy mode, the battery has a huge 100km range (all range tests were conducted using a 85kg/190lbs in a mild headwind condition). We've also incorporated a very sophisticated battery management system to detect cell performance and balance, with an incredibly accurate charge indicator.

Because Kona is all about quality, our electric assist bikes are the first on the market to pass the stringent CEN 15194 standard for Pedelec bikes in Europe.

KONA SIZING AND FIT

Sizing and fit have always been one of the main strengths of the Kona range, with more stock sizes available than any other bike company. With our range of bicycles expanding significantly over the last couple of years, we felt it was time to overhaul our size scale.

We started with the overwhelming request for longer top tubes on our XC mountain bikes. The average increase is ½-inch (15-20mm), which we coupled with shorter stems and slightly shorter headset stack heights. The steps between sizes were evened out to ½-inch or 1-inch increments, and there are still up to 7 sizes: from 14-inch to 22-inch on many models.

In the asphalt range, top tube lengths were marginally lengthened, with the size gaps revised to even 15 to 20mm steps. There are still up to 6 sizes" from 46cm to 61cm on most models.

When it's called for, seat posts are either offset or straight to maximize the reach and power output of the rider. More importantly, the overall sizing on mountain bikes and road bikes allow Kona dealers and riders to determine their fit more easily from model to model and category to category.

The net result is better fit on the entire range, with a simplified system that allows easy fine-tuning and a perfect marriage of bike and rider throughout our entire 2011 range.

LIFETIME WARRANTY

Kona warrants to the original owner that the frame of this new Kona bicycle purchased from an authorized Kona dealer shall be free of defective materials or workmanship for the lifetime of ownership by the original owner. During this warranty period, Kona shall repair or replace, at its sole option, the bicycle frame if Kona determines the frame is defective and subject to this limited warranty. The original owner shall pay all labor and shipping charges connected with the repair or replacement of the bicycle frame. Please see the Kona Owners manual provided with your bicycle for additional information.

XC DUAL SUSPENSION

PLATFORM OVERVIEW

With the wave of a wand, the trails of the world get smoother, faster, shorter, and a hell of a lot more fun. New for 2011, the revolutionary adaptability of Kona's G2 Magic Link rear suspension technology is now available on a short-travel XC bike, the super speedy 2+2, a two-inch travel bike blessed with an extra two-inches of rear suspension when required. We've also introduced the new Tanuki, named after a mythical Japanese forest creature known for its jolly, over-indulgent, ballsy, and good spirited nature. The Kona Tanuki is a superlight, 130mm travel bike made for smoothing out the backcountry. Then, of course, there's the Magic Link Cadabra series, the 105-160mm all-mountain maestro's trick of choice.

2+2

XC DUAL SUSPENSION

TECH FEATURES

- Ultimate marathon, multi-stage XC bike
- New model with Gen2 Magic Link equipped rear travel with 50-100mm travel range
- Kona Race Light Scandium Butted frame with hydroformed tubing
- Shimano Deore XT/SLX 10-speed drivetrain
- Avid Elixir brakes
- Easton EA70 wheelset

We helped refine and proliferate one of the most important inventions ever formulated in the history of all things: the mountain bike. Forests become accessible. Hills, climbable. Wilderness, penetrable. Smiles, fantastical. For 2011 our legendary collection of XC hardtails sees new frame fabrications using formed tubing for the best use of material possible. Stiffer, with great trackability and compliancy to best bump over the world's great inspirations. Whether it's your first mountain bike, or your 10th, no singular bike company has done it better, for longer, by having this much fun.

Ride the 72km coastal course, try the revamped 40km course or ride the 24km course with surprises for the kids and the young at heart.

Join us for our 10th Anniversary event!

Saturday March 12th 2011

Colville, Coromandel Peninsula, New Zealand.

- Kona 7005 Aluminum Butted frame
- Reliable 100mm RockShox Dart One fork
- Shimano hydraulic disc brakes/24-speed gearing
- Burn trail, not bucks

PLATFORM OVERVIEW

From the ground up, bikes for Kona ladies are designed specifically to harness girl power: from frame design and geometry to graphics, components to the actual model offerings themselves, everything has been made with the female cyclist at the fore. Bikes specifically designed for women just getting into mountain biking, right through to those who want to podium; backcountry enthusiasts to blossoming road riders. The Kona Lisa series, ride a masterpiece.

TECH FEATURES

- Women's specific geometry and components
- Kona 7005 Aluminum Butted frame
- Perfect mountain bike for new-to-the-sport recreational female cyclists
- Smooth Rock Shox Dart2 fork with lockout
- Quality Shimano 9-speed drive train and Shimano hydraulic disc brakes

The big bike revolution has been, well, "big" here at Kona. We're into it, and have been for some time. It's the speed and confidence of 29-inch wheel bikes that fires us up the most. Since we began making 29ers five years ago, we've worked hard to ensure our line of hardtails and dual suspension models reside at the top of the stack when it comes to weight, durability and performance. Using Race Light Scandium and aluminum frames, with low bottom brackets and component packages developed specifically for 29er bikes (not to mention two giant Twin Timber bike testers Ryan Trebon and Barry Wicks, it's no surprise our line is stratospheric.

UNIT 29ER

TECH FEATURES

- Fully rigid, Kona Cromoly Butted, singlespeed 29-inch wheel mountain bike
- Shortened chainstays for a quicker, stable, more nimble ride
- Improved sliding dropouts are lower profile and stronger
- Redesigned Kona Project fork with bigger/tapered fork blades
- Avid BB7 Disc brakes

TECH FEATURES

- The ultimate dual suspension 29-inch wheel mountain bike
- Tough enough to ride the North Shore, light enough to win the BC Bike Race
- Kona Race Light Scandium Butted frame with hydroformed tubing and 100mm travel
- More standover, setback seat post, smaller rockers, Zero Stack 1.5 Tapered Headtube
- New Fit cartridge-equipped Fox 32F29 RLC, fully adjustable fork

Born from more than a decade-long legacy in the freeride game, one that saw the Stinky rise to immortality as one of the most revolutionary mountain bike's ever created, today, Kona's line of gravity rides still retains the spirit of the original, with some sweet dashes of the future to keep it all fresh. Consider the climbing ability and big down adaptability of the Magic Link equipped CoilAir, the durability and affordability of the Stinky TL, and now, the all-new gorgeous deliverance of the Operator FR, our newly minted long travel beauty.

DIRT JUMP / SLOPESTYLE

PLATFORM OVERVIEW

As jumps get bigger and riders bolder, we continue to keep pace by refining our longstanding commitment to all that goes up and down, and up and down again. Honed to perfection after years of trial and test, the Bass screams to the top of the slopestyle pile. Same goes for the mighty Cowan, now lighter, stiffer and leaner. The crommo steel Shonky, an emerging cult favorite on track pumps and street, now features smoother lines and more core components. These are the bikes of the Kona Clump, the nastiest grouping of gravity-fueled mountain bikers on the planet.

BASS

DIRT JUMP / SLOPESTYLE

TECH FEATURES

- The Kona Clump Slopestyle competition bike of Paul Basagoitia and Graham Aggasiz
- Kona Clump 7005 Butted Aluminum Frame with 4-inches of front/rear travel

DIRT JUMP / TRAIL

PLATFORM OVERVIEW

We know that some bikes need to do it all. From jumping to technical singletrack, from the want for durability and affordability to a bike designed specifically to deal with the burl of your backyard. Our mandate to make bicycles for every kind of cyclist manifests here, in rides made for those who need to put mega into the mountain. From the tough-as-nails Five-O, the utilitarian performance of the Shred and Stuff, to the all-new 5-inch chromo Steely, which joins the classic prestige and feel of steel with rowdy modern geometry. At Kona we make tough bikes for tough people who love to ride tough stuff.

With a bevy of World Championships to our credit, we've put all our experience, heart and soul into our newest downhill creation: the Operator DH series. We took what we learned from the durability, performance and geometry of the Stab and integrated into a new design that is lighter, stiffer, more durable, and easier to maintain, not to mention way more sexy. Out-of-the box, these bikes are ready to rule the rigors of downhill racing. Just ask Joe Smith, who's moved from 50th in the World to Top 10 since joining the Kona Factory Team in 2009.

When it comes to road bikes, our approach is more practical than most. As long time cyclists, we don't want you sacrificing comfort for fashion. We also know that performance is crucial, but not to the extent that it makes riding a pain-literally. When we first started building road bikes in 1993, we were one of the first companies to use sloping top tubes, a unique carryover from our revolutionary mountain bike geometry that results in a compact rear triangle and more efficient power transfer-with more comfort to boot. Since we're not a Tour team brand, we make our bikes for the black sheep road rider, choosing more comfortable aggressive geometries and materials, as opposed to uncomfortable aggressive. Using steel, Scandium and carbon fiber, with a host of different models depending on individual style, we make road easy, efficient and fast.

Cruise to a beach party (Humu), commute to school (Bike), pack home a week's worth of groceries (Ute), or bust through bumpy backroads and support humanitarian causes (AfricaBike Three), our new SimpliCITY collection offers everything the urban cyclist needs to get the job done, with fun and style considered at every intersection. New for 2011, we introduce our first foray into electric assist bikes: the Electric Ute, Token and Ticket. Designed to make urban cycling more effortless via rechargeable, battery power assist drives, Kona jumps into the future of designing and building bikes for a revolutionary tomorrow.

AFRICABIKE THREE SIMPLICITY

TECH FEATURES

- Durable, affordable, easy riding city steed
- Flagship of Kona's humanitarian Basic Needs program
- For every two AfricaBikes sold, one is donated to someone in need
- New lightweight butted aluminum frame with built-in rear rack to carry heavy loads
- Shimano 3-speed internal rear hub

ASPHALT / COMMUTER

PLATFORM OVERVIEW

You ride to work because a) it feels damn good, b) it's faster, cheaper and way more fun than a car (or the bus) and c) because you care about this big blue dot called Home. That, fine cycling friend, is why we build a collection of commuter bikes as multicultural as any metropolis, from full, over-the-top candy rides to utilitarian workhorses; the simplicity of internal gearing to suspension systems designed to take the edge off the downtown. Whether it's drop bars, flat bars or raised bars, using quick, efficient and comfortable designs that are elegant and fun to ride, at a wide range of price points in a huge range of sizes (we offer nine different models of commuter specific models to choose from), at Kona, bicycle transportation is all about opportunity, choice and tapping into the engine inside. Rise up Pedaltarian. Rise up.
